GenAI declaration - COS30045 Demonstration 2

Student name: _____ Student ID: _____

Date: 25 October 2026

Tool used

OpenAI Codex (ChatGPT) was used on 25 October 2026 as a coding assistant.

How it was used

The assistant read the provided Demonstration 2 and Week 4-6 exercise PDFs, helped plan the deliverables, generated and revised HTML, CSS, JavaScript and SVG code, processed the local TV CSV and an external AEMO-derived price CSV, and checked that the charts rendered and the Week 6 filter responded in a browser.

Where the output appears

AI-assisted output is in the four exercise pages, JavaScript chart files, SVG artwork, annotation image, data-building script, README, and derived CSV files in the demo2 folder. The raw TV and AEMO-derived source CSVs are kept in source_data for traceability.

Sources and limitations

The exact course CSVs were not available locally. The TV charts use a February 2026 local registration snapshot. The Week 5 price charts use a separately sourced 2006-2024 time series with a different averaging method. These differences are identified on the pages and in README.md.

Student review

Before submission, I will verify the data, links and visualisations, make any needed corrections, and ensure I can explain the code and my use of GenAI during the oral demonstration. This declaration should be updated if further AI assistance is used.
